It currently consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     contig of 8302 bp in length age of unknown length contig of 10070 bp in length age age of unknown length contig of 6350 bp in length age of unknown length length age of unknown length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human FHIT gene at chromosome 3p11.2, spanning the constitutive chromosomal fragile site FRA3B, is often altered in most common forms of human cancer. The NIII protein overcomes the mutated inactivation of the genome alleles. The NIII genes, encoded polypeptides, derivatives and analogues of them, and antibodies are used as diagnostic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents the coding region of human, murine, brosophila melanogaster and Caenorhabditis elegans NIT1 gene. The human and mouse NIT1 genes are members of an uncharacterised mammalian gene family with homology to bacterial and plant nitrilases. The tumour suppressor gene FHIT in D. melanogaster and C. elegans code for fusion proteins in which the Fhit domain is fused with a NIT domain is fused with a NIT domain in mouse and humans, FHIT and NIT are encoded by two different genes, localised on chromosomes 3 and 1 in human and 14 and 1 in mouse. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NIT1 gene; nitrilase; tumour suppressor gene; FHIT; chromosome 3p14.2; FRA3B; cancer; genome allele inactivation; ss.

The prostate cancer antiquens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, valnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen oppuncieotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. ```
The specification describes secreted proteins and their corresponding polynucleotides which are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the amount of the secreted polypeptides in a sample or by determining the presence of mutations in the polynucleotides. Specific uses are described for each of the products, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, CS disorders, diseases of the immune system, autoimmune diseases, hepatic and renal diseases diabetes, inflammation, allerdies, ischemic shock, Alzheimer's prostate diseases, asthma, disorders involving osteoclasts such as osteoporosis, arthritis or malignancies, diseases of testes, lung or thymus, digestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners.
                                                                                                                                                                                                                                                             or ameliorating

defined cDNA nucleotide sequence encoding human, Xenopus lawyis and mouse Nit2 proteins. Nit and Fhit proteins are encoded as fusion proteins in invertebrates and as separate polypeptides in vertebrates. Nit and Fhit interact physically and functions in same cellular pathways molecules which bind Nit2 and minic or antagonise Fhit interaction are used to treat diseases in which activity of Nit2 protein is altered in treat proliferative disorders, whilst Fhit antagonists promote cell proliferation and are particularly useful to treat sequence is frog Nit1 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated cDNA encoding human, mouse, frog and yeast Nit2 proteins, useful to find molecules that mimic or antagonize Fhit interaction for the treatment of proliferative or degenerative diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA2001B.DAT:ABL12225
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Drosophila melanogaster expressed polynucleotide SEQ ID NO 31157

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01876) and the encoded proteins

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176 ABL3051), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WiPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; SEQ ID NO 12139; 21pp + Sequence Listing; English

                                                                                                                                                                                                                                                 177
                                                                                                                                                                                                                                                                                                                                                                                                         227
```

```
The present invention relates to human hNit3-ase (nitrilase) protein, which is expressed in Cushings adrenal gland tumour, and its coding sequence (AAF84214 and AAB80984). The present invention also relates to a preparation method of said protein and nucleic acid sequence, and a method of detecting human hNit3-ase nucleic acid sequence and polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human nitrile hydrolytic enzyme protein and its coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CGCTTGGCCCTCATCCAGCTTCAGATTTCTTCCATCAAATCAGATAACGT 160

The invention relates to isolated nucleic acids comprising a fully defined cDNA nucleotide sequence encoding human. Xenopus laevis and mouse Nit2 proteins. Nit and Fhit proteins are encoded as fusion proteins in invertebrates and as separate polypeptides in vertebrates. Nit and Fhit interact physically and functions in same cellular pathways. Molecules which bind Nit2 and mimic or antagonise Fhit interaction are used to treat diseases in which activity of Nit2 protein is altered in a mammal. Fhit mimics induce apoptosis and are particularly useful to proliferation and are particularly useful to treat proliferation and are particularly useful to treat proliferation and are particularly useful to treat degenerative disease. The present sequence is human Nit2 cDNA.
                                                                                                                                                                                                                                                                                                         for
                                                                                                                                                                                                                                                                   Isolated cDNA encoding human, mouse, frog and yeast Nit2 proteins, useful to find molecules that mimic or antagonize Fhit interaction the treatment of proliferative or degenerative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         yAlaValValAlaThrTyrArgLySThrHisLeuCysAspValGluIleP 170

The invention relates to isolated nucleic acids comprising a fully defined cDNA nuclectide sequence encoding human, Xenopus laevis and mouse Nit2 proteins. Nit and Fhit proteins are encoded as fusion proteins in invertebrates and as separate polypeptides in vertebrates. Nit and Fhit interact physically and functions in same cellular pathways. Molecules which bind Nit2 and mimic or antagonise Fhit interaction are used to treat diseases in which activity of Nit2 protein is altered in a mammal. Fhit mimics induce apoptosis and are particularly useful to treat proliferative discorders, whilst Fhit antagonists promote cell proliferation and are particularly useful to treat degenerative discounse Nit2 cDNA.
                                                                                                                                      Isolated cDNA encoding human, mouse, frog and yeast Nit2 proteins, useful to find molecules that mimic or antagonize Fhit interaction for the treatment of proliferative or degenerative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             135

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA8244

represent specifically claimed Neisseria meningitidis genomic DNA captuences; AAA81260 to AAA81303 and AAA825620 to AAA825650 represent Postageners used in the sequences; AAA81259 and AAA81301 and AAA81312 represent Post primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 and AAA81312 represent Postageners, and AAA8132 to AAA81452 and AAA81302 to AAA81452 and AAA81302 to AAA81452 and AAA8130 and AAA8130 bNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF captuence, which are nucleic acid sequences, protein sequences, and antibodies invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition on be used in the manufacture of a composition of bost of a composition can be used as medicament (or in the manufacture of a composition of variances of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences and/or against all laso facilitate production of biological probes, from the bacterium will also facilitate production of biological probes, confortion antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and other mans and provide an opportunity to identify secreted or surface charman be read and antigenically variable or at least more conserved than other mans and antigenically variable or at least more conserved than
Isolated nucleotide sequences of Neisseria meningitidis which can be used in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 69936 BP; 16512 A; 19259 C; 17399 G; 16763 T; 3 other;

```
The present invention describes the full length genome of
Neisseria meningitidis B (NMB). The sequences in AAP21544 and AAP21607
to AAP21613 represent fragments of the NMB genomic sequence, as the
sequence was too long to go in a record on its own it was split into B
sequence by 49980 bp (i.e. the last 49980 bp of AAP21544 is repeated at
the beginning of AAP21607, the last 49980 bp of AAP21587 are repeated at
the beginning of AAP21608, and so on). AAP21545 to AAP21589 to
the beginning of AAP21608, and so on). AAP21545 to AAP21589 to
the beginning of AAP21608, and so on). AAP21545 to AAP21589 to
AAP21606 represent PCR primers which have seed in the exemplification of
the present invention. The NMB genome and fragments from it have
the present invention. The NMB genome and fragments from it have
the present anculaic acids, proteins and/or antibodies which binds to the
proteins can be used in compositions for treating or preventing infection
the presence of Neisserial bacteria or as a diagnostic reagent for detecting the
presence of Neisserial bacteria or of antibodies raised to Neisserial
bacteria. Computers, computer memory, computer storage medium or computer
databases can be used in a search to identify open readium or compute
catcher opportunities to film antigenic or immunogenic proteins which are
more effective in vaccines than the outer membrane proteins currently
                                                                                                            Masignani V;
Rappuoli R;
                                                                                                                                                                                                                                             Neisseria meningitidis B full length genome sequence and open readi
frames are used to detect, treat and prevent Neisserial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 349980 BP; 84410 A; 84863 C; 94187 G; 86520 T; 0 other;

Sequences: AAAB1201 and AAAB1205 to AAAB1254 to AAAB1259 and AAAB1205 and AAAB1254 to AAAB1259 and AAAB1204 to AAAB1201 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAAB1321 to AAAB1254 to AAAB1259 and AAAB1304 to AAAB131 represent PCR primers used in the isolation of the present isolation of the present inventor. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all pathogenic Neissariae. Identification of sequences and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of blological probes, particularly organism specific probes. Attempts to make efficacious particularly organism specific probes. Attempts to make efficacious well-valent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                                                                                  Scarlato V;

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; sequences have activities such as: cytostatic; heuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; antithrenmatory; antidiabetic; nordiance; The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy contropics and incleases of complete acids may be used to treat cancers, proliferative discase, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus allerial or fungal infection malaria, autchimmune disorders, asthma, allerial, anderial or fungal infection, malaria, autchimmune disorders, asthma, allerial, anderial or cartilage damage, cardiors when a purchase and cartilage damage, allergies, apparent and purps, wounds, bone and cartilage
                                       Human; open reading frame; ORFX; detection; cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; anticonvulsant; osteopathic; antiparthritic; immunosuppressant; cardiant; immunostimulant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antival; antibacterial; antifungal; antirheumatic; antithyroid; antianaemic; gene therapy; cancer; proliferative disorder; hypotherapy; cancer; proliferative disorder; osteoarthritis; graft vs host disease; cardiovascular disease; diabetes mellitus; hypothyroidism; SCID; AIDS; severe combined immunodeficiency; malaria; autoimmune disorder; asthma; allergy; aplastic anaemia; nocturnal haemoglobinuria; burn; wound;
                                                                                                                                                                                                                                                                                                                                 bone damage; cartilage damage; antiinflammatory disease; coagulation;
thrombosis; contraceptive; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    293
                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions
                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 35843; 21pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100 CAAGGACAAAGTGGCCAATGTCCAAAACGCCGTCACCAAAATCGAGGCGG 149

ALE Submission

AL Submitted (30-JAN-2002) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CBIO 18A, UK. E-mail enquiries:

Cambridgeshire, CBIO 18A, UK. E-mail enquiries:

humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk

On Feb 1, 2002 this sequence version replaced gi:17902927.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations

variation annotation may not be found in the sequence submission

corresponding to the overlapping clone name. Note that the

variation annotation may not be found in the sequence submission

corresponding to the overlapping clone, as we submit sequences with

only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all

regions were either double-stranded or sequenced with an alternate

chemistry or covered by high quality data (i.e., phred quality) >=

30); an attempt was made to resolve all sequencing problems, such

as compressions and repeats; all regions were covered by at least

one plasmid subclone or more than one MI3 subclone; and the

assembly was confirmed by restriction digest. The following

abbreviations are used to associate primary accession numbers given

in the feature table with their source databases: Em; EMBL; Sw;

SMISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP

database can be found at

thrownsome 1, constructed by the Sanger Centre Chromosome 1 Mapping

Group. **Leastor*** **Leastor*** **Leastor** *

```
The STS is derived from PCR amplicons generated from genomic DNA, sequenced from each end using the amplification primers. The sequence does not necessarily represent the entire amplicon. Sequence derived from PolyPhred was trimmed from each end of each unique contig until five consecutive bases exceeded a quality score threshold of 20, and the next 10 bases averaged a quality score of 20 or greater. Amplicon size was estimated by agarose gel

   NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 44 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
  Worley, K.C.

It currently consists of 67 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as arbitrary. Gaps between the contigs are represented as Trus of N, but the exact sizes of the gaps are unknown. This record will be updated with the flinished sequence as soon as it is available and the accession number will be preserved.
  Direct Submission
Submitted (13-JUL-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Jul 12, 2002 this sequence version replaced gi:18092812.

Center: Baylor College of Medicine
   Submitted (09-JAN-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, Tx 77030, USA (bases 1 to 181583)

Nucleotide sequence of the coding region of NIT1 gene.

NIT1 gene; nitrilase; tumour suppressor gene; FHIT; chromosome 3p14.2; FRA3B; cancer; genome allele inactivation; ss.

Mus sp. Drosophila melanogaster. Caenorhabditis elegans. Homo sapiens.

```
The present sequence represents the coding region of human, murine, Drosophila melanogaster and Caenorhabditis elegans NIT1 gene. The human and mouse NIT1 genes are members of an uncharacterised mammalian gene family with homology to bacterial and plant nitrilases. The tumour suppressor gene FHIT in D. melanogaster and C. elegans code for fusion proteins in which the Fhit domain is fused with a Nit domain. In mouse and humans, FHIT and NIT are encoded by two different genes, localised on chromosomes 3 and 1 in human and 14 and 1 in mouse. The human FHIT gene at chromosome 3p14.2, spanning the constitutive chromosomal fragile site FRA3B, is often altered in most common forms of human cancer. The Nit1 protein overcomes the mutated inactivation of the genome alleles. The NITI genes, encoded polypeptides, derivatives and analogues of them, and antibodies are used as diagnostic and

   reardioactive, immunomodulatory, muscular, valuerary, gastrointestinal, nephrotropic, antinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome dentification, as chromosome markers, and for numerous other diagnostme or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to
  AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic,

   polynucleotides which are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the amount of the secreted polypeptides in a sample or by determining the amount of the secreted polypeptides in a sample or by determining the amount of the secreted polypeptides. Specific uses are described for each of the products, based on which tissues they are most highly contracted in, and include developing products for the diagnosis or treatment of cancer, tumnours, neurodegenerative disorders, developmental abornmalities and foetal deficiencies, blood disorders, cNS disorders, diseases of the immune system, autoimmune diseases, arbhair and renal diseases, asthma disorders, ischemic shock, Alzheimer's and cognitive disorders, schizophrenia, cardiovascular disorders, prostate diseases, asthma disorders involving osteoclasts such as osteoporosis, arthritis or malignancial diseases of testes, lung or thymus, digestive/endocrine disorders, infections and AIDS. The company of the productions are also useful for identifying their binding partners.

useful for stimulating and/or expanding T cells specific for a tumour protein for determining the presence of a cancer in a patient. A composition containing the polynucleotide and/or polypeptide is useful for treating a lung cancer in a patient. The polypeptide is useful for removing tumour cells from a biological sample. The polynucleotide is also useful as probe or primer to detect the level of mRNA encoding a tumour protein. This sequence encodes a lung tumour associated protein or protein. This sequence encodes a lung tumour associated protein or protein fragment, described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly

The invention relates to isolated nucleic acids comprising a fully defined cDMA nucleotide sequence encoding human, Xenopus laevis and mouse Nit2 proteins. Nit and Fhit proteins are encoded as fusion proteins in invertebrates and as separate polypeptides in vertebrates. Nit and Fhit interact physically and functions in same cellular pathways. Molecules which bind Nit2 and mimic or antagonise Fhit interaction are used to treat diseases in which activity of Nit2 protein is altered in a mammal. Fhit mimics induce apoptosis and are particularly useful to treat proliferative discorders, whilst Fhit antagonists promote cell proliferation and are particularly useful to treat sequence is frog Nit1 cDNA.
   Isolated cDNA encoding human, mouse, frog and yeast Nit2 proteins, useful to find molecules that mimic or antagonize Fhit interaction for the treatment of proliferative or degenerative diseases

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) colynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancer metastases of haematopoietic-derived cells. AK64703 co AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK84942 to AAK84950 and AAM82169 cores represent invention.
Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

The invention relates to nucleic acids (I) that hybridise under stringent conditions to any of 999 sequences (ABQ65424-ABQ66422) or their fragments. (I) are used to express the corresponding polypeptides (II) or to produce genetically modified plant cells or transgenic plants, which may have improved resistance to disease or stress, or altered nutritional or medicinal products), or generally any trait of interest, or can be used to screen for biologically active agents (e.g. fungicides,
   insecticides and antibiotics).

Note: The sequence date for this patent din not form part of the printed specification, but was obtained in electronic format directly from the USPTO at sequence.html?DocID=999909770149.

   The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1
  Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;
   The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Prosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGITG-ABLIGITG), expressed DNA sequences (ABLIGITG) and the encoded proteins
  Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders

in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide squences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumnurs, Reloid, degenerative disorders, haemorthage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypethyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious

   diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut reperfusion or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage.

The invention relates to detecting (M1) granulocyte (GC) activation

Claim 1; SEQ ID No 1189; 114pp; English.

drug toxicity

```
The present sequence is provided in a specification relating to a method for predicting the amount of intraabdominal adipose tissue.

The method involves relating the amount of adipose tissue to the expression level of at least one gene transcription product which has a 491 or 2090 residue amino acid sequence and is encoded by a 2.376 or 2090 base pair sequence, or which can hybridise to a 2385 or the 2090 base pair sequence, or which can hybridise to a 2385 or the 2090 base pair sequence under stringent conditions. The method includes a step of deriving the area value of the intraabdominal adipose tissue at the cross section of abdominal navel, from the expression level of a gene transcription product in a sample of the intraabdominal adipose tissue. The method can be used for predicting the amount of intraabdominal adipose tissue. The present sequence encodes a gene transcription product whose
   expression level may be measured as part of this method.
                       Claim 1; Page 15-23; 33pp; Japanese.

Neisseria meningitidis.

```
The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414 cerpresent specifically claimed Neisseria meniagitidis genomic DNA sequences; AAA81260 to AAA81260 to AAA81260 to AAA81264 to AAA81259 and AAA8120 to Cresponding proteins; AAA81254 to AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA81322 to AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF cequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used as medicament of a composition. The composition can be used as medicament of a composition of the composition can be used as medicament of the interior of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences for from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance.

The present invention describes the full length genome of
Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607
to AAF21613 represent fragments of the NMB genomic sequence, as the
sequence was too long to go in a record on its own it was split into B
sequence by 49980.bp (i.e. the last 49980 bp of AAF21544 is repeated at
the beginning of AAF21607, the last 49980 bp of AAF21545 are repeated at
the beginning of AAF21608, and so on). AAF21545 to AAF21589 to
AAF21606 represent PCR primers which are used in the exemplification of
the present invention. The NMB genome and fragments from it have
archiacterial activity, and can be used in vaccines and gene therapy.
Neisseria nucleic activity, and can be used in vaccines and gene therapy.
Neisserial pacteria or as a diagnostic reagent for detecting the
presence of Neisserial bacteria or of antibodies which binds to the
presence of Neisserial bacteria or of antibodies reagent for detecting the
presence of Neisserial or of antibodies reagent for detecting the
presence of Neisserial bacteria or of antibodies raised to Neisserial
chatchases can be used in a search to identify open reading frames (ORFS)
   or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the outer membrane proteins currently

Sequence 4, Application US/09893191

Sequence 4, Application US/09893191

Patent No. US20020038270A1

GENERAL INFORMATION:

TITLE OF INVENTION: METHODS AND COMPOSITIONS FOR

TITLE OF INVENTION: TRANSCRIPTION-BASED NUCLEIC ACID AMPLIFICATION

FILE REPERENCE: 49269-20006.00

CURRENT APPLICATION NUMBER: US/09/893,191

CURRENT APPLICATION NUMBER: 60/213,908

PRIOR FILING DATE: 2000-06-26

PRIOR FILING DATE: 2000-06-26

PRIOR FILING DATE: 2000-03-21

NUMBER OF SEQ ID NOS: 20
